

Network Monitoring Operations Report

Monitoring operations report | RPT-NETMON-2026-Q2

Document owner	Network Engineering
Effective date	2026-06-30
Applicable reference	DE.CM-01 - Network monitoring

Monitored services

Network Engineering forwards firewall, VPN, DNS, cloud flow-log, and production load-balancer events to the SIEM. The SOC monitors these sources continuously for suspicious connections, unusual egress, repeated authentication failures, and changes to perimeter rules.

Coverage review

The Q2 review confirms coverage for the primary data center, the production cloud environment, remote access, and the corporate office network. Sensor health is checked every fifteen minutes and outages create an incident ticket.

Open coverage item

The Pune branch still routes user traffic through a managed service-provider appliance that exports only availability metrics. Its connection events and DNS activity are not forwarded to the SIEM, and no network detection sensor is installed at the branch. The replacement circuit and sensor deployment are scheduled for 15 October 2026.

Review conclusion

Monitoring is effective for the listed core environments; the branch exception remains open in the network risk register pending telemetry validation.
